Incident analysis process summary

**Step 1: Form an incident analysis team**
- Ensure all appropriate disciplines are represented
- Include front-line staff who understand related care processes
- Determine team member roles and responsibilities

**Step 2: Gather information/initial understanding**
- Review original prescription and other relevant documents
- Develop initial understanding of event and identify additional information needed

**Step 3: Develop final understanding and timeline**
- Review physical environment, packaging and labelling, and conduct interviews
- Conduct literature review to determine relevant standards of practice, evidence-based guidelines, preventive strategies and interventions
- Develop narrative timeline and final understanding of sequence of events leading to incident

**Step 4: Identify contributing factors and underlying problems**
- Use diagramming to move away from the sharp end to the underlying problems that contributed to the incident

**Step 5: Develop problem statements**
- Draft a problem statement to help articulate the underlying issues and form the basis for action

**Tip:**
- Use the A B C format: A = antecedent B = behaviour/bridge C = consequences
- (A) This set of circumstances (B) increased/decreased the likelihood (C) that this set of consequences would/would not occur.

**Step 6: Develop action plan**
- Specifically address underlying problems with objective and measurable actions that encourage system-level changes. Action plans should be **SMART** (Specific, Measurable, Attainable, Relevant, and Time-based)

**Tip:**
- Consider human factors engineering principles and the hierarchy of effectiveness.

**Step 7: Implement actions**
- Assign actions to specific individuals and specify timelines
- Plan carefully; consider barriers to implementation and pilot test changes
- Use small cycles of change model: Plan, Do, Study, Act (PDSA)
- Consider whether additional measures or changes are needed and implement as necessary
Incident analysis process - detailed version

**Step 1: Form an incident analysis team**
- Ensure all appropriate disciplines are represented
- Include front-line staff who understand related care processes
- Determine team member roles and responsibilities

**Step 2: Gather information/initial understanding**
- Review original prescription and other relevant documents
- Develop initial understanding of event and identify additional information needed

![Figure 1: Sample initial understanding](image)

**Step 3: Develop final understanding and timeline**
- Review physical environment, packaging and labelling, and conduct interviews
- Conduct literature review to determine relevant standards of practice, evidence-based guidelines, preventive strategies and interventions
- Develop narrative timeline and final understanding of sequence of events leading to incident

Step 4: Identify contributing factors and underlying problems

- Use diagramming (below) to move away from the sharp end to the underlying problems that contributed to the incident

Tips:
- To help identify root causes, remember the bottom line: If this factor were eliminated or corrected, would there be a real chance to prevent a similar event from occurring?

Figure 2: Sample tree diagram with underlying problems (root causes) identified in yellow
Use the Minimum Scope Checklist (below) and the Triage and Triggering Questions (page 5) to help identify system and process issues and broaden the scope of the analysis.

This checklist has been adapted from the assessment criteria developed by the US Joint Commission\(^1\) for the root cause analysis of a medication error.\(^2\)

---

1 The Joint Commission is the primary accrediting body for healthcare organizations and programs in the United States. Organizations accredited by the Joint Commission are expected to conduct a root cause analysis of any sentinel events and provide a report to the Commission within 45 days of the event or becoming aware of the event.

Triage and triggering questions for incident analysis

The United States Veterans Affairs National Center for Patient Safety, a world leader in patient safety and root cause analysis, has developed a list of triage and triggering questions to assist analysis teams in conducting incident analyses. These questions are not the only questions to be asked during an incident analysis, but are designed to help identify contributing factors and underlying problems that may not otherwise be considered. These questions have been adapted to focus on issues relevant to medication incidents in community pharmacy.

Starting point

Was this event thought to be the result of a criminal act, a purposefully unsafe act related to alcohol or substance abuse (impaired provider/staff), or events involving alleged or suspected patient abuse of any kind (i.e., those situations which are outside the scope of the patient safety program)? If YES, request that the incident analysis process be stopped and that an administrative process be started.

I. Human factors: Communication

Questions in this section are intended to help assess issues related to communication, flow of information and availability of information as needed.

1. Was the patient correctly identified?
2. Was information from various patient assessments shared and used by members of the treatment team on a timely basis?
3. Did existing documentation provide a clear picture of the work-up, the treatment plan and the patient’s response to treatment? (Including, for example, assessments, consultations, orders, treatment team notes, medication administration records, lab reports, etc.)
4. Was communication between management/supervisors and front line staff adequate?
5. Was communication between front line team members adequate?
6. Were policies and procedures communicated adequately?
7. Were there methods for monitoring adequacy of staff communication? Were there methods for read-back, confirmation of messages, debriefs, etc.?
8. Was there a manufacturer’s recall/alert/bulletin on file for medication or equipment at the time of the event or close call? Were relevant staff members aware of the recall/alert/bulletin?
9. If relevant, were the patient and their family/significant others actively included in the assessment and treatment planning?
10. Did management establish adequate methods to provide information to employees who needed it in a manner that was easy to access/use and timely?
11. Did the overall culture of the facility encourage or welcome observations, suggestions or early warnings from staff about risky situations and risk reduction? (Also, has this happened before and was anything done to prevent it from happening again?)

II. Human factors: Training

These questions are related to routine job training, special training and continuing education, including the timing of that training. Training issues may concern application of approved procedures, correct use of equipment or appropriate manipulation of protective barriers. These questions also focus on the interfaces between people, workspace and equipment.

1. Was there a program to identify what is actually needed for training of staff?
2. Was training provided prior to the start of the work process?
3. Were the results of training monitored over time?
4. Was the training adequate? (If not, consider supervisory responsibility, procedure omission, flawed training, flawed policies or procedures.)
5. Were training programs for staff designed up-front with the intent of helping staff perform their tasks without errors?
6. Had procedures and equipment been reviewed to ensure that there was a good match between people and the tasks they did, or people and the equipment they used (i.e., application of human factors engineering principles)?
7. If equipment was involved, did it work smoothly in the context of staff needs and experience, existing procedures, requirements and workload, physical space and location?

III. Human factors: Fatigue/scheduling

Questions in this section weigh the influence of stress and fatigue that may result from scheduling and staffing issues, sleep deprivation or environmental distractions such as noise. These questions also evaluate relationships to training issues, equipment use, and management concern and involvement.

1. Were the levels of vibration, noise or other environmental conditions appropriate?
2. If applicable, were environmental stressors properly anticipated (e.g., distractions)?
3. Did scheduling allow personnel adequate sleep?
4. Was fatigue (e.g., due to workload or scheduling) properly anticipated?
5. Was there sufficient staff with the appropriate skills on hand for the workload at the time?
6. Was the level of automation appropriate for the tasks to be accomplished?

IV. Environment: Equipment

These questions are intended to help evaluate factors related to use and location of equipment, fire protection and disaster drills, codes, specifications and regulations, the general suitability of the environment, and the possibility of recovery after an error has occurred. These questions show that what appears to be equipment failure may relate to human factors issues, policy and procedure questions, and training needs.

1. Was the work area/environment designed to support the function it was being used for?
2. Were the work environment stress levels (either physical or psychological) appropriate (e.g., temperature, space, noise)?
3. Did the work area/environment meet current codes, specifications and regulations?
4. Was there adequate equipment to perform the work processes?
5. Was there a documented safety review/maintenance program performed on the equipment involved? If relevant, was recommended service/recall/maintenance, etc., completed in a timely manner?
6. Were emergency provisions and back-up systems available in case of equipment failure?
7. Was the equipment designed such that usage mistakes would be unlikely to happen?
8. Had this type of equipment worked correctly and been used appropriately in the past?
9. Were personnel trained appropriately to operate the equipment involved in the adverse event/close call?
10. Did the design of the equipment enable detection of problems and make them obvious to the operator in a timely manner?

11. Were equipment displays and controls working properly and interpreted correctly?
12. Was the medical equipment or device intended to be reused (i.e., not a single use device)?

V. Rules: Policies/procedure

Questions in this section are focused on the existence and ready accessibility of policies and procedures, including technical information for assessing risk, mechanisms for feedback on key processes, effective interventions developed after previous events, compliance with national and provincial regulations, and the usefulness of and incentives for compliance with codes, standards and regulations. This section also considers the qualifications of the facility and employees for the level of care provided, orientation, and training for compliance with safety and security measures including handling of hazardous material and emergency preparedness, and the availability of information to all part-time, temporary or voluntary workers and students.

1. Was there an overall management plan for addressing risk and assigning responsibility for risk management?
2. Did management have an audit or quality control system to inform them how key processes related to the adverse event are functioning?
3. Had a previous audit been done for a similar event, were the causes identified and were effective interventions developed and implemented on a timely basis? Would this problem have gone unidentified or uncorrected after an audit/review?
4. Was required care for the patient within the scope of the organization’s mission, staff expertise and availability, technical and support service resources?
5. Were the staff involved in the adverse event or close call properly qualified and trained to perform their functions?
6. Were all involved staff oriented to the job, facility and unit policies regarding: safety, security, hazardous material management, emergency preparedness, medical equipment management?
7. Were there written up-to-date policies and procedures that addressed the work processes related to the adverse event or close call?
8. Were these policies/procedures consistent with relevant provincial and national standards and regulations?
9. Were relevant policies/procedures clear, understandable and readily available to all staff?
10. Were the relevant policies and procedures actually used on a day-to-day basis?
11. If the policies and procedures were not used, what got in the way of their usefulness to the staff?

VI. Barriers

1. What barriers and controls were involved in this adverse event or close call?
2. Were these barriers designed to protect patients, staff, equipment, or environment?
3. Was patient risk considered when designing these barriers and controls?
4. Were these barriers and controls in place before the event happened?
5. Had these barriers and controls been evaluated for reliability?
6. Were the relevant barriers and controls maintained and routinely checked by designated staff?
7. Would the adverse event have been prevented if the existing barriers and controls had functioned correctly?
Table 2: Sample excerpt from drug incident report identifying contributing factors

### Contributing Factors

To be completed by the staff member(s) with the most knowledge of the incident. Mark an X to the left of each applicable item.

- Patient identification process
- Transcription/order entry process
- Patient assessment process (e.g., questions to gather information on new and refill medications incomplete or lacking)
- Counselling process (e.g., hearing/visual impairment, low literacy skills, language barrier, availability/provision of written materials)
- Monitoring process (e.g., follow-up not completed, lab values not available/not reviewed)
- Drug order interpretation (e.g., misread/misheard/misinterpreted)
- Drug unavailable (e.g., supply shortage and no alternative drug obtained on behalf of patient)
- Education/training/skills/experience (e.g., unfamiliarity with drug product, device, or process)
- Compounding process (e.g., assignment of incorrect beyond-use-date, complex formula, formula not available, drug stability problem, procedure unhygienic, cross-contamination)
- Prescribing problem (e.g., problematic abbreviations, legibility issues)
- Checking process (e.g., pharmacist working alone, ingredient check omitted/failed, final check omitted/failed)
- Documentation process (incomplete/unclear)
- Drug storage/security (e.g., narcotic safe left unlocked)
- Environmental factors (e.g., pharmacist working alone, fatigue due to extended shift/short-staffing, interruptions, higher than normal Rx volume, look-alike packaging, look-alike/sound-alike drug names, technology)
- Other - please specify:
**Step 5: Develop problem statements**

- Draft a problem statement to help articulate the underlying issues and form the basis for action

Tip:
- Use the A B C format: A = antecedent B = behaviour/bridge C = consequences
- (A) This set of circumstances (B) increased/decreased the likelihood (C) that this set of consequences would/would not occur.
- e.g., Unclear role definition increased the likelihood that a student would work outside his/her skill set, in this case selecting the incorrect form of insulin, leading to the dispensing and administration of the incorrect insulin and the resulting acute hypoglycemia.

**Step 6: Develop action plan**

- Specifically address underlying problems with objective and measurable actions that encourage system-level changes. Action plans should be SMART (Specific, Measurable, Attainable, Relevant, and Time-based).

Tip:
- Consider human factors engineering principles and the hierarchy of effectiveness.

**High leverage - most effective**
1. Forcing functions and constraints
2. Automation/computerization

**Medium leverage**
3. Simplification/standardization
4. Reminders, checklists, double checks

**Low leverage - least effective**
5. Rules and policies
6. Education and information
Table 3: Sample action and measurement plan with causal statements

<table>
<thead>
<tr>
<th>Action #</th>

<td>Immediate</td>
<td>Dispensary manager</td>
<td>Audit weekly x 6 weeks, then monthly, then quarterly</td>
</tr>
<tr>
<td></td>
<td>B Report look-alike labeling to manufacturer, Health Canada and ISMP Canada.</td>
<td>Low - education and information (but potential for higher level change)</td>
<td>Immediate</td>
<td>Dispensary manager</td>
<td>N/A - no internal measurement plan</td>
</tr>
</tbody>
</table>

*Root cause # 1
Unclear role definition increased the likelihood that a student would work outside his/her skill set, in this case selecting the incorrect form of insulin, leading to the dispensing and administration of the incorrect insulin and the resulting acute hypoglycemia.

*Root cause # 2
Storage of both intermediate and rapid-acting insulins in close proximity in the refrigerator increased the likelihood of incorrect product selection and dispensing of the incorrect insulin, leading to administration by the patient and the resulting acute hypoglycemia.

*Root cause # 3
Pharmaceutical “branding” through look-alike packaging increased the likelihood of incorrect product selection and dispensing of the incorrect insulin, leading to administration by the patient and the resulting acute hypoglycemia.
Step 7: Implement actions

- Assign actions to specific individuals and specify timelines
- Plan carefully; consider barriers to implementation and pilot test changes
- Use small cycles of change model: Plan, Do, Study, Act (PDSA)
- Consider whether additional measures or changes are needed and implement as necessary

Figure 4: PDSA model
Drug incident - patient safety report

1. As per Standard 1.9 of the Standards of Practice for Pharmacists and Pharmacy Technicians, each pharmacist and pharmacy technician must participate in the quality assurance processes required by the Standards for the Operation of Licensed Pharmacies.

2. Use this form for all related drug incidents.

3. As per Standard 6.4(b), the regulated member involved in the drug error must document an account of the error as soon as possible after the discovery. If the regulated member involved is not on duty at the time of discovery, the regulated member or employee who discovers the drug error must initiate the documentation.

4. Notify all regulated health professionals and caregivers whose care for the patient may be affected by the drug error.

5. Attach Rx & transaction record – photocopies or originals are acceptable.

6. Retain this report for 10 years from discovery date.

7. This form is for drug incidents, drug errors and adverse drug events only; not adverse drug reaction reporting (ADRs).

8. All reports must be reviewed at least quarterly to evaluate success of changes implemented (Standard 6.6).

What is a drug incident? (Standard 6)

a. Drug incident means any preventable event that may cause or lead to inappropriate drug use or patient harm. Drug incidents may be related to the practice of pharmacists or the practice of pharmacy technicians, drugs, health care products, aids and devices, procedures or systems, and include:
   - prescribing;
   - order communications;
   - product labeling, packaging, nomenclature;
   - compounding;
   - dispensing;
   - distribution;
   - administration;
   - education;
   - monitoring; and
   - use.

b. Adverse drug event means an unexpected and undesired incident related to drug therapy that results in patient injury or death or an adverse outcome for a patient, including injury or complication.

c. Drug error means an adverse drug event or a drug incident where the drug has been released to the patient.

Patient Information

Name: Sam Anyone
Address: 123 Anystreet Rd.
          Anytown, AB TOT OTO
Phone: 780-123-4567

Sex: M or F (circle)

D.O.B.: 01/02/42
weight = 75 kg
Rx #: 123456
New or repeat Rx (circle)

Other relevant demographic data:

Pharmacy use only - retain for 10 years from discovery date.
Incident date & discovery date

Incident date: 1900 05/05/2011
Discovery date: 1000 06/05/2011

Name of reporter & Incident discoverer

Discovered by: Joe Droganit E. Ph. name / position / title
Report completed by: Joe Droganit E. Ph. name / position / title

Drug ordered
State: drug/dose/form/hours/directions for use. Remember to attach RX & transaction record.
Rocephin 2 g 50/70pm IV/1h dil (25 units/m, 12 units/hr) via lumen in pen

Incident description
State only the facts as known at the time of discovery of the incident. Additional detail about the incident may be appended to this form as it becomes available (e.g., final understanding/time line and Incident analysis findings).

Patient was called to say that patient experienced a severe low blood sugar reaction requiring treatment in the Emergency Department (ED) and the doctor discovered that the wrong insulin had been dispensed. When insulin supply was checked, found 4 vials of Novolin 2000 U/mL (short-acting insulin) and one box of NovoLipid (long-acting insulin). Patient injected incorrect insulin (NovoLipid) resulting in hypoglycemia and treatment in ED.

Severity
Mark an X to the left of the applicable scenario.

X Mild: Patient is symptomatic, symptoms are mild, loss of function or harm is minimal or intermediate but short term, and no or minimal intervention (e.g., extra observation, investigation, review or minor treatment) is required.

If no harm occurred in this case, was there significant potential for harm? Yes No (circle)

If the patient received incorrect medication, or did not receive medication that should have been received, how many doses were involved? 1 (circle)
Type of Incident

Mark an X to the left of each applicable item.

- Incorrect drug
- Incorrect patient
- Incorrect dose/ strength
- Documented allergy/ ADR to drug dispensed
- Incorrect/inappropriate packaging (e.g., child-resistant packaging not used, or packaged without regard to nature of drug including light and temperature requirements)
- Incorrect label/directions
- Incorrect dosage form/incorrect route
- Omission (drug not supplied/unremit condition)
- Drug interaction not followed up
- Therapeutic duplication
- Outdated product
- Incorrect quantity
- Incorrect generic substitution/incorrect brand supplied
- Incorrect indication/incorrect or improper administration (e.g., injection provided to a child under 5 years)
- Other - please specify:

Contributing factors

To be completed by the staff member(s) with the most knowledge of the incident.
Mark an X to the left of each applicable item.

- Patient identification process
- Transcription/order entry process
- Patient assessment process (e.g., questions to gather information on new and refill medications incomplete or lacking)

Outcome of Investigation

Problems Identified: Use the causal statement format to describe underlying problems/contributing factors identified through incident analysis.

1. Understaffing in pharmacy has increased the workload that a pharmacy technician would work at 1/5/2011, leading to the dispensing and administration of the incorrect medication and the resulting adverse event.
2. Poor communication between pharmacy technicians and pharmacy staff has increased the likelihood of identifying the incorrect dosage form, leading to the dispensing and administration of the incorrect medication and the resulting adverse event.
3. Failure to follow-up on pharmacy technicians' orders has increased the likelihood of dispensing and administering the incorrect medication and the resulting adverse event.
4. Limited understanding of the potential consequences of dispensing the incorrect medication has increased the likelihood of dispensing and administering the incorrect medication and the resulting adverse event.
5. Failure to follow-up on pharmacy technicians' orders has increased the likelihood of dispensing and administering the incorrect medication and the resulting adverse event.
6. Failure to follow-up on pharmacy technicians' orders has increased the likelihood of dispensing and administering the incorrect medication and the resulting adverse event.

Actions to be implemented

Favour higher leverage (effectiveness) change options where possible. Note that the actions below are in descending order of leverage. Actions should be SMART: Specific, Measurable, Attainable, Relevant and Time-based.

Forcing functions/controls:
Contact software vendor by March 12, 2011 to discuss implementation of electronic verification forcing functions that must occur before the prescription can be released [i.e., multiple drug packages dispensed require independent verification/escrow] to ensure medication errors are detected. Obtain implementation date from software vendor at time of contact.

Reminders, checklists, double-checks:
Pharmacy technicians to apply warning labels to all look-alike/look alike products in refrigerator by March 7, 2011. Pharmacy manager to audit weekly a 5 weeks times monthly, then quarterly.

(Continued on next page)
Actions to be Implemented (continued)

Simplifications/standardization:
- Pharmacy technician to aggregate short-, intermediate- and long-acting insulin in the refrigerator by March 7, 2011.
- Pharmacy manager to audit weekly x 6 weeks then monthly, then quarterly.

Pharmacy manager to develop standard job descriptions by May 1, 2011 for all dispensary staff with clearly defined role, expectations and review any variances during orientation. Pharmacy manager will perform annual audits to ensure job descriptions for all positions.

Education or training provided/course(s) taken:
- Pharmacy manager immediately requires final check of DIN to be performed by pharmacist or registered pharmacy technician on each item that will be part of the final package. Process to be observed by pharmacy manager weekly x 6 weeks then monthly, then quarterly to reinforce compliance.

Pharmacy technician to train pharmacy technicians to check that DIN on all items to be packaged match that of the label. Pharmacy technician responsible for training to audit weekly x 6 weeks then monthly, then quarterly. All staff to begin scanning each item that will be part of the final package immediately. Process to be observed by pharmacy manager weekly x 6 weeks then monthly, then quarterly to reinforce compliance.

Pharmacy manager to provide a copy of the job description by May 15, 2011, review expectations during orientation of new staff members, and follow-up with individual staff at time of annual performance review.

Other (please specify):
- Novo Nordisk (manufacturer of insulin) and EMF Canada to be contacted by pharmacy manager by March 10, 2011 to advise of nature of error and potential for change in product labeling to make differences more obvious.

---

Evaluation

Please describe whether the actions taken have resolved the issue. Is the patient satisfied with the outcome? Has the potential for recurrence been mitigated?

Additional patient/physician's wife and physician that the above actions have now been to minimize chance of recurrence. Will monitor as a quarterly basis to ensure changes implemented continue to be effective.

Date: 06/09/2011
Name: [Signature]
Position: R.Ph.

Drug Incident Report Form

Drug incident - patient safety report

1. As per Standard 1.9 of the Standards of Practice for Pharmacists and Pharmacy Technicians, each pharmacist and pharmacy technician must participate in the quality assurance processes required by the Standards for the Operation of Licensed Pharmacies.

2. Use this form for all related drug incidents.

3. As per Standard 6.4(b), the regulated member involved in the drug error must document an account of the error as soon as possible after the discovery. If the regulated member involved is not on duty at the time of discovery, the regulated member or employee who discovers the drug error must initiate the documentation.

4. Notify all regulated health professionals and caregivers whose care for the patient may be affected by the drug error.

5. Attach Rx & transaction record – photocopies or originals are acceptable.

6. Retain this report for 10 years from discovery date.

7. This form is for drug incidents, drug errors and adverse drug events only; not adverse drug reaction reporting (ADRs).

8. All reports must be reviewed at least quarterly to evaluate success of changes implemented (Standard 6.6).

What is a drug incident? (Standard 6)

a. Drug incident means any preventable event that may cause or lead to inappropriate drug use or patient harm. Drug incidents may be related to the practice of pharmacists or the practice of pharmacy technicians, drugs, health care products, aids and devices, procedures or systems, and include

- prescribing;
- order communications;
- product labeling, packaging, nomenclature;
- compounding;
- dispensing;
- distribution;
- administration;
- education;
- monitoring; and
- use.

b. Adverse drug event means an unexpected and undesired incident related to drug therapy that results in patient injury or death or an adverse outcome for a patient, including injury or complication.

c. Drug error means an adverse drug event or a drug incident where the drug has been released to the patient.

### Drug ordered

### Incident description

State only the facts as known at the time of discovery of the incident. Additional detail about the incident may be appended to this form as it becomes available (e.g., final understanding/time line and incident analysis findings).

### Severity

Mark an X to the left of the applicable scenario.

- **None:** Patient is not symptomatic or no symptoms detected and no treatment required.
- **Mild:** Patient is symptomatic, symptoms are mild, loss of function or harm is minimal or intermediate but short term, and no or minimal intervention (e.g., extra observation, investigation, review or minor treatment) is required.
- **Moderate:** Patient is symptomatic, requiring intervention (e.g., additional operative procedure; additional therapeutic treatment), an increased length of stay, or causing permanent or long term harm or loss of function.
- **Severe:** Patient is symptomatic, requiring life-saving intervention or major surgical/medical intervention, shortening life expectancy or causing major permanent or long term harm or loss of function.
- **Death:** On balance of probabilities, death was caused or brought forward in the short term by the incident.

### If no harm occurred in this case, was there significant potential for harm? Yes No (circle)

### If the patient received incorrect medication, or did not receive medication that should have been received, how many doses were involved?
### Type of Incident

Mark an X to the left of each applicable item.

- Incorrect drug
- Incorrect patient
- Incorrect dose/strength
- Documented allergy/ADR to drug dispensed
- Incorrect/inappropriate packaging (e.g., child-resistant packaging not used, or packaged without regard to nature of drug including light and temperature requirements)
- Incorrect label/directions
- Incorrect dosage form/incorrect route

Omission (drug not supplied/untreated condition)
- Drug interaction not followed up
- Therapeutic duplication
- Outdated product
- Incorrect quantity
- Incorrect generic substitution/incorrect brand supplied
- Incorrect indication/incorrect or improper administration (e.g., injection provided to a child under 5 years)

Other - please specify:

### Contributing factors

To be completed by the staff member(s) with the most knowledge of the incident.

Mark an X to the left of each applicable item.

- Patient identification process
- Transcription/order entry process
- Patient assessment process (e.g., questions to gather information on new and refill medications incomplete or lacking)
- Counselling process (e.g., hearing/Visual Impairment, low literacy skills, language barrier, availability/provision of written materials)
- Monitoring process (e.g., follow-up not completed, lab values not available/not reviewed)
- Drug order interpretation (e.g., misread/misspelled/mistyped)
- Drug unavailable (e.g., supply shortage and no alternative drug obtained on behalf of patient)
- Education/training/skills/experience (e.g., unfamiliarity with drug product, device, or process)

Compounding process (e.g., assignment of incorrect beyond-use-date, complex formula, formula not available, drug stability problem, procedure unhygienic, cross-contamination)
- Prescribing problem (e.g., problematic abbreviations, legibility issues)
- Checking process (e.g., pharmacist working alone, ingredient check omitted/failed, final check omitted/failed)
- Documentation process (incomplete/unclear)
- Drug storage/security (e.g., narcotic safe left unlocked)
- Environmental factors (e.g., pharmacist working alone, fatigue due to extended shift/short-staffing, interruptions, higher than normal rates, look-alike packaging, look-alike/sound-alike drug names, technology)

Other - please specify:
Notifications

Complete the following in accordance with SOLP 6.6(h) and (i)

Patient:

Prescriber:

Licensee:

Others:

Staff Involved notified

Outcome of Investigation

Problems Identified: Use the causal statement format to describe underlying problems/contributing factors identified through incident analysis.

A = Antecedent  (A) This set of circumstances
B = Bridging  (B) Increased/decreased the likelihood
C = Consequences  (C) That this set of consequences would/would not occur.

Actions to be Implemented

Favour higher leverage (effectiveness) change options where possible. Note that the actions below are in descending order of leverage. Actions should be SMART: Specific, Measurable, Attainable, Relevant and Time-based.

Forcing functions/controls:

Automation/computationalization:

Reminders, checklists, double checks:

continued on next page
Actions to be Implemented (continued)

Simplifications/standardization:

Policy/procedure change:

Education or training provided/course(s) taken:

Other (please specify):

Evaluation

Please describe whether the actions taken have resolved the issue. Is the patient satisfied with the outcome? Has the potential for recurrence been mitigated?

Drug Incident - Patient Safety Report - Addendum

Please attach details of drug incident investigation including initial/final understanding, timelines, and incident analysis findings, including causal chains as applicable.
Sample Drug Incident Quarterly Review Report

Follow-up process: Standards for the Operation of Licensed Pharmacies

6.6 The licensee must, at least quarterly
   a. review the drug-error reports for the licensed pharmacy to evaluate whether practice changes or preventative measures are required to prevent future drug errors, and
   b. assess whether any changes implemented as a result of a drug error were successful in advancing patient safety.

6.7 Nothing in Standard 6.6 relieves a licensee from the duty to make changes or take preventative measures promptly in response to a drug error if the protection of the public requires it.

6.8 The licensee must communicate the results of the licensee’s drug error review to all employees who work in the prescription department, along with any other information required to assist in ensuring that the risk of a drug error is reduced.

Retain this report for 10 years.

How to complete this report

For each quarter, please document

1. drug incidents and required actions reviewed - consider a review of ISMP Canada drug error reports for insight on similar errors;

2. any significant findings (e.g., repeated incidents of similar errors - are there any patterns?); and

3. further actions implemented and whether those actions resolved the issue.

Pharmacy information

Pharmacy name: PPC Drugstore
Address: 456 Anyroad Ave
          Anytown, AB T2T 2T2
Phone: 780-456-7890
Email: ph1@ppcdrugs.ca
Licensee name: Sam Pharmer
Reporting year: 2011
First quarter review - January to March

Three drug incidents this quarter: 1. Rx 123-456 - Incorrect strength dispensed
2. Rx 111-222 - Incorrect strength dispensed
3. Rx 333-444 - Incorrect strength dispensed.
Of note, is all 3 cases product label appearance similar to one another, increasing the likelihood that the incorrect drug products were selected and dispensed to the wrong patient. Expanded education of pharmacy staff.

Review date: 01/04/2011

Second quarter review - April to June

Review date: 

Third quarter review - July to September

Review date: 

Fourth quarter review - October to December

This adaptation of the Canadian Root Cause Analysis Framework for the community pharmacy setting has been completed by the Alberta College of Pharmacists with assistance from ISMP Canada and permission from the Canadian Patient Safety Institute. The Canadian Root Cause Analysis Framework was developed collaboratively by the Canadian Patient Safety Institute, ISMP Canada and Saskatchewan Health in 2005/06 to provide a standardized approach to the analysis of critical incidents and near miss events in healthcare.

The Institute for Safe Medication Practices Canada (ISMP Canada) is an independent national not-for-profit agency committed to the advancement of medication safety in all healthcare settings. ISMP Canada works collaboratively with the healthcare community, regulatory agencies and policy makers, provincial, national and international patient safety organizations, the pharmaceutical industry and the public to promote safe medication practices. ISMP Canada’s mandate includes analyzing medication incidents, making recommendations for the prevention of harmful medication incidents, and facilitating quality improvement initiatives.

More information about ISMP Canada is available at www.ismp-canada.org.

The Alberta College of Pharmacy governs pharmacists, pharmacy technicians, and pharmacies in Alberta to support and protect the public’s health and well-being. The College takes responsibility for pharmacy practice by setting and enforcing high standards of competence and ethical conduct. Major activities include ensuring that only qualified pharmacists and pharmacy technicians are licensed in the province, and that they maintain their knowledge and skills at the highest level possible. The College also ensures that pharmacies provide a practice environment for their employees that supports quality practice and the safety of their clients.

More information about the Alberta College of Pharmacy is available at abpharmacy.ca.
